

# How To Make Your Own Quarantine Wedding AR Filter

## Introduction:

In this tutorial, you will be learning how to use Spark AR to create your own AR Filter using Head Occluder and 3D Objects. Covid-19 has changed the way we interact as a community. With this AR filter, you can allow people to be part of the event without actually being there. Your friends and family that can't make it can utilize this filter and share on their Instagram.

You will learn:

1. Downloading and setting up Spark AR Studio
2. Creating and modifying a head tracking project
3. Adding objects and animations
4. Utilizing the Head Occluder
5. Putting all together to make the filter

This tutorial is for complete beginners and just assumes you have access to a computer that can run Spark AR. Not required, but nice to have would be pre existing digital objects that you want to incorporate into your filter.

## Getting Started:

In order for this to work best, you can create your own 3D object. This tutorial assumes you already have a 3D object or that you will be using one of the built in assets available in Spark AR Studio. If you want to create your own 3D asset, you can do so in either Tinkercad.com or by using Paint 3D in Windows 10. This entire tutorial can be done using default assets, but for the best effect, you'll want to bring in your own 3D objects.

## Step 1: Download Spark AR Studio

1. Go to <https://sparkar.facebook.com/ar-studio>
2. Click on **Download** on the top right corner, pink button.

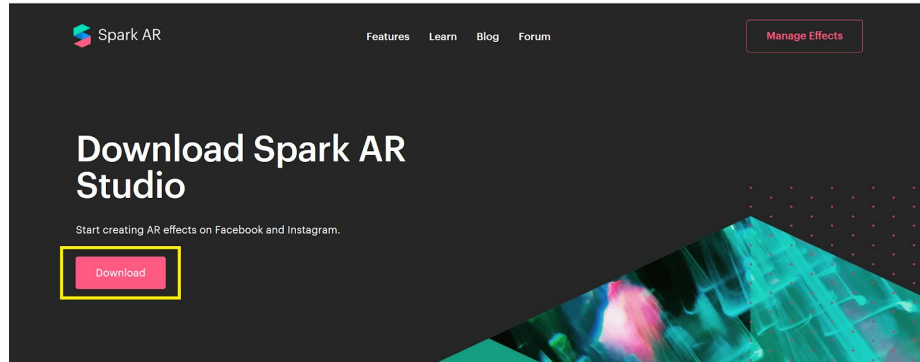

Features Learn Blog Forum

Manage Effects

Download

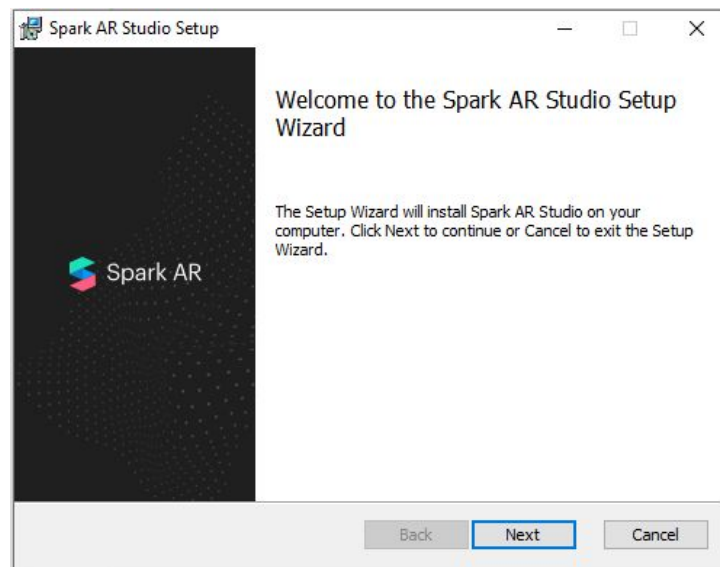

3. Then click on the next pink button that says **Download**.

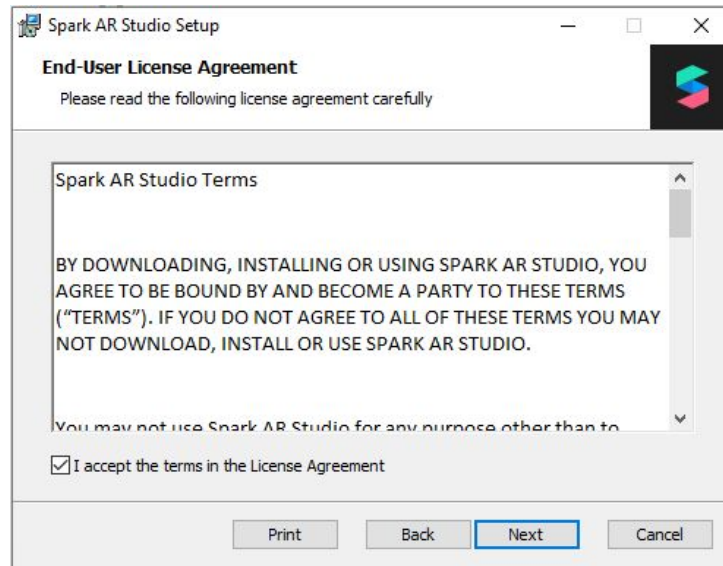

And that's it. Depending on your internet connection, it will take a few minutes to download. Now, let's install the software!

## Step 2: Installing Spark AR Studio

1. Click on the downloaded image called **SparkARStudio\_v98.msi**.
2. Follow the instructions to install. Click on **Next**.

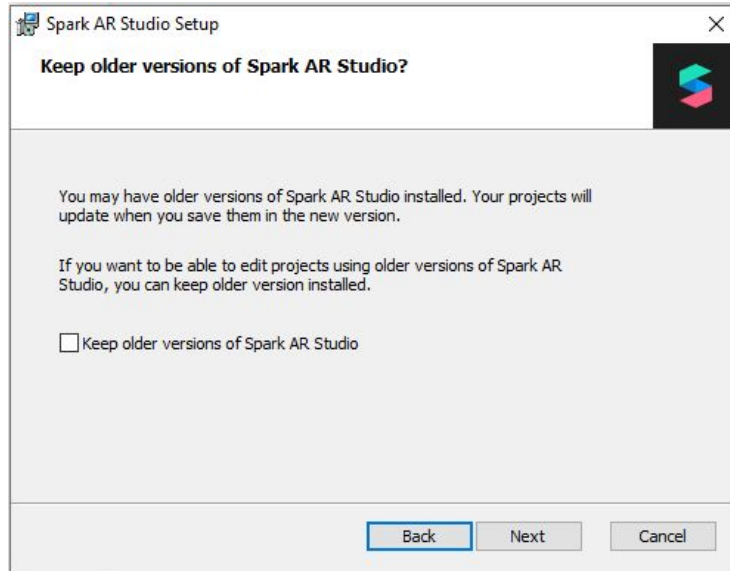

3. Read and accept terms in the License Agreement. Click on **Next**.

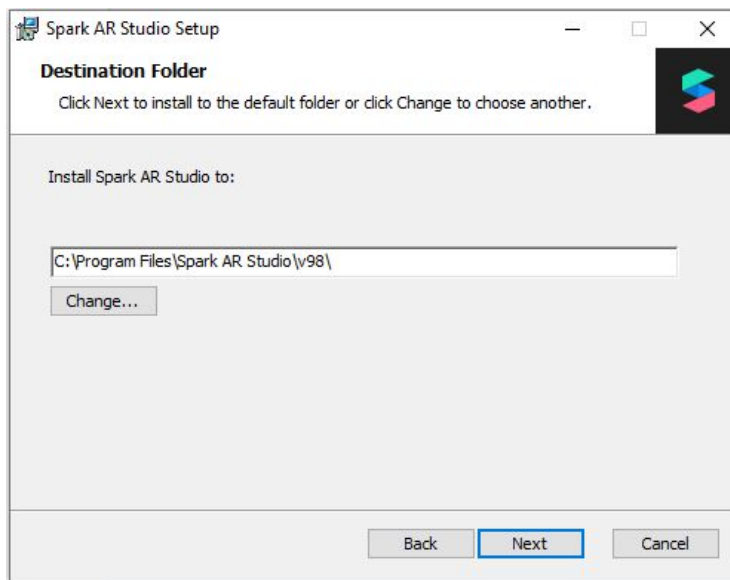

4. Follow special instructions for iOS users. Click **Next**.

5. This screen is just to keep older versions of Spark AR Studio on your computer. Check the box if that is what you want to do. Then click on **Next**.

6. Choose where you want the program to be installed. Click on **Next**.

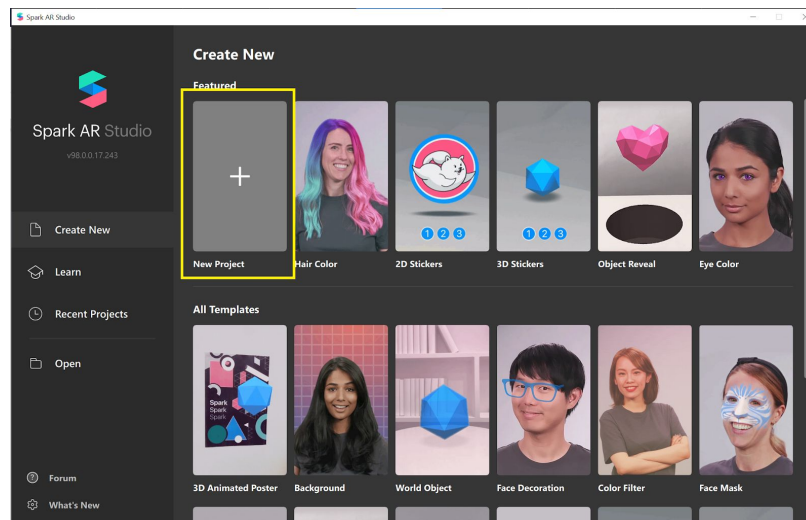

7. Finally, click on **Install**. Note: you might get a pop-up window that says that this installation will change some devices. Click on **Yes**, then it will finish installing.

Now that you have the software installed, it's time to roll up your sleeves and start creating. This tool is super powerful and there's a lot going on.

### Step 3: Starting your first project

1. Open Spark AR Studio and log in.
2. Click on **New Project**.

3. On the pop-up screen select **Blank Project**.

## Let's get started.

Choose what type of project you want to create.

### Plane Tracking

Place objects on a horizontal surface, like a floor or table.

### Target Tracking

Anchor experiences to an image in the real world, like a poster.

### Face Tracking

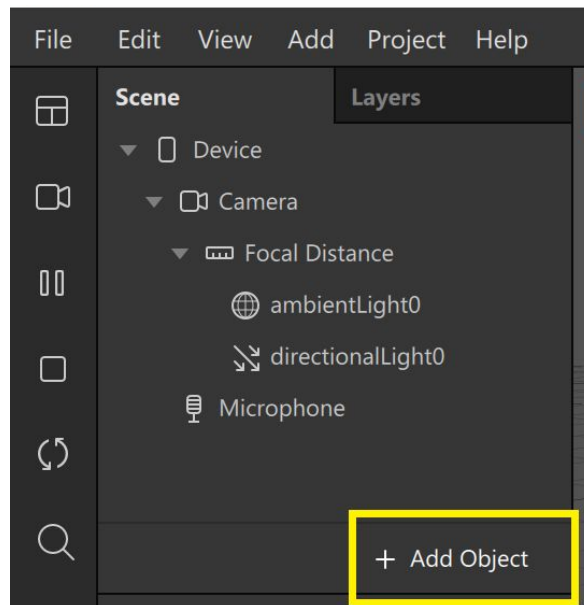

Create an effect that responds to or augments someone's face.

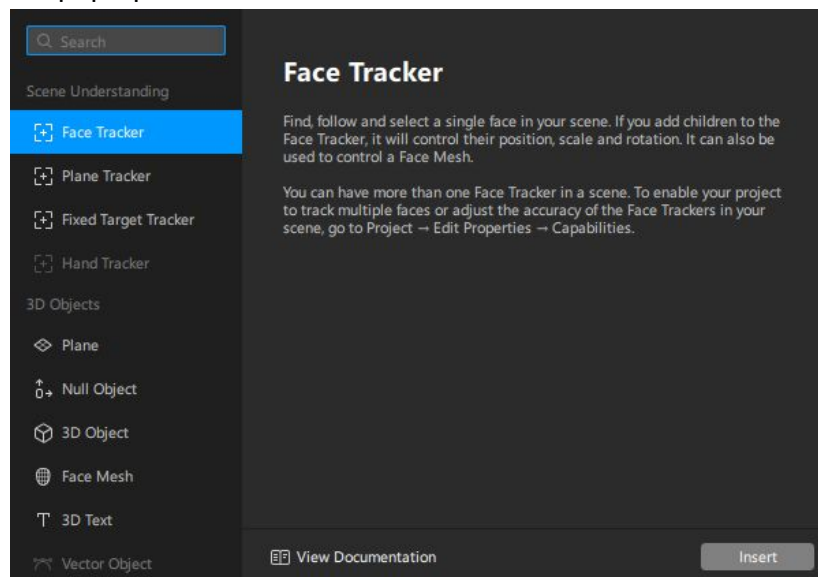

### Blank Project

Build any type of experience.

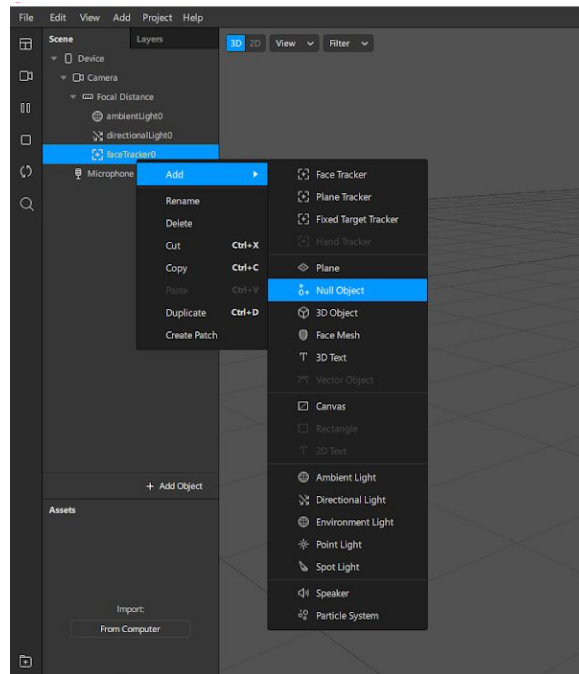

4. Click on **+ Add Object**, located in the **The Scene panel**, top left section of screen.

5. On the pop-up select **Face Tracker** and then click on the **Insert** button.

6. Right click on **faceTracker0**, located in **The Scene panel**, top left section, go to **Add** → **Null Object**.

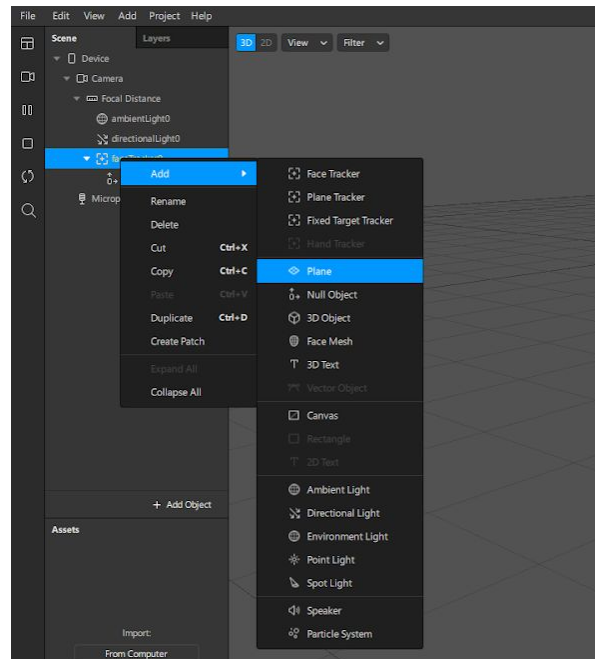

This will add the item below to **The Viewport**.

7. Right click on **faceTracker0**, located in **The Scene panel**, top left section, go to **Add** → **Plane**.

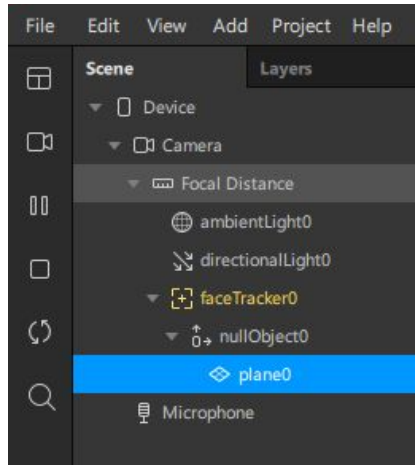

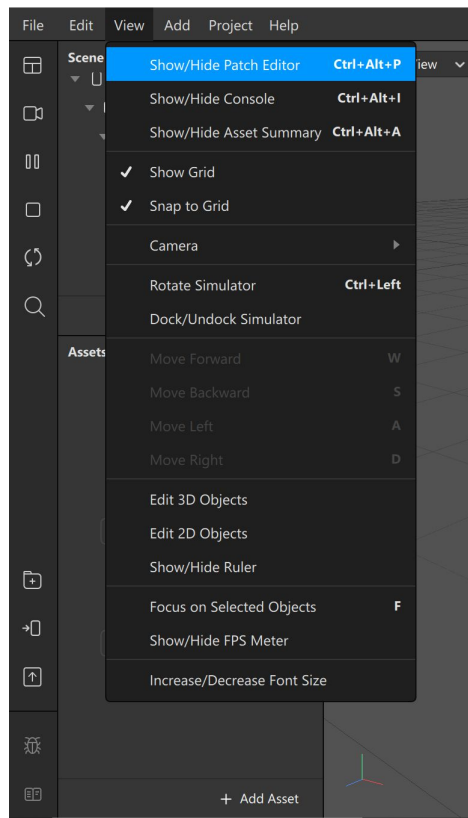

This will add the checker box to **The Viewport**.

8. Drag **plane0**, located in **The Scene panel**, into **nullObject0**. It should look like this.

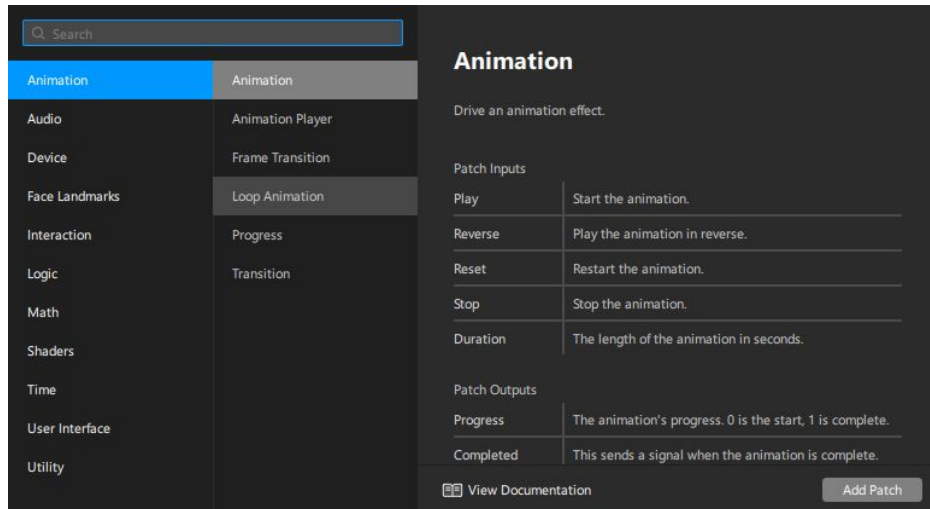

9. On the top menu, click on **View** → **Show/Hide Patch Editor**

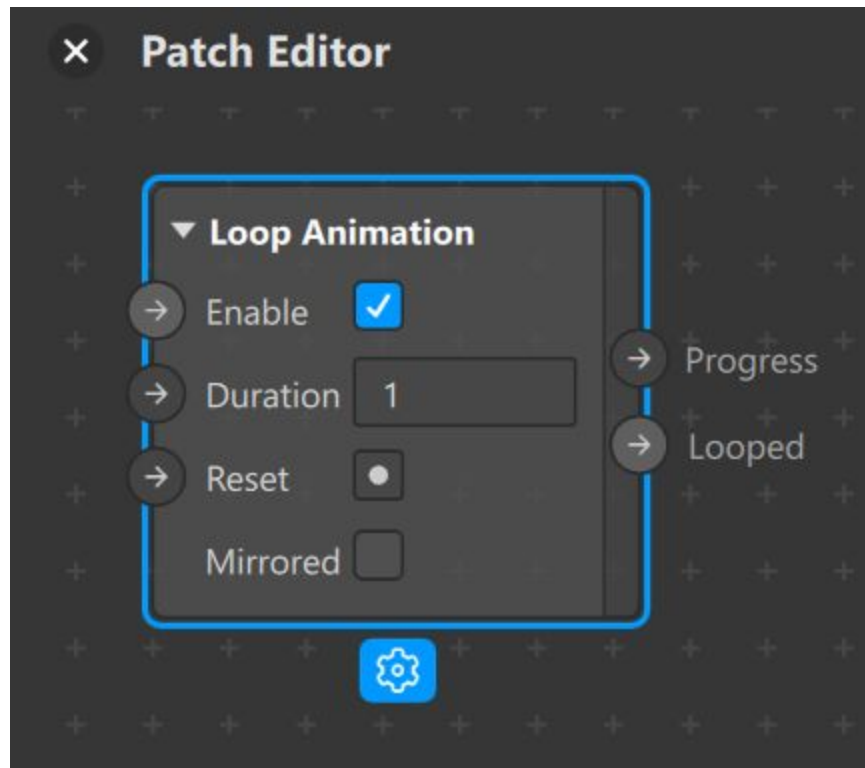

## Step 4: Adding the Animation Loop

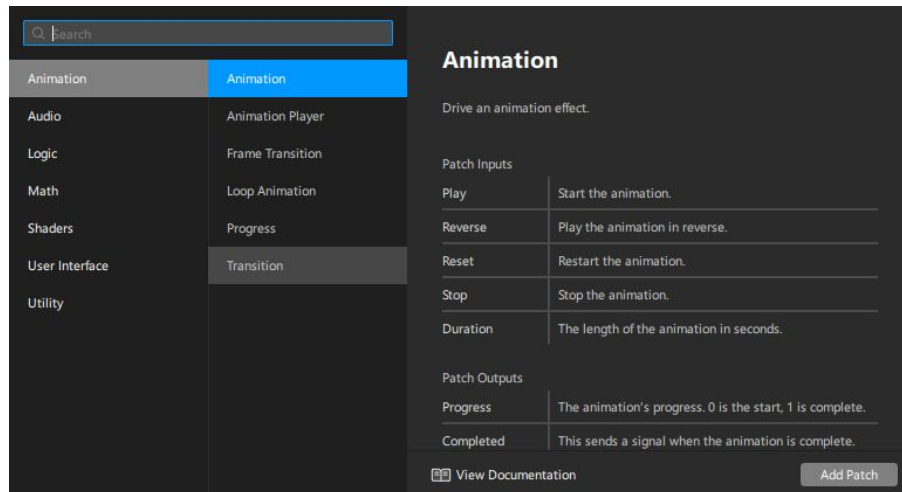

1. With **plane0** selected, right click in the **Patch Editor**, select **Animation --> Loop Animation** and then click on the button **Add Patch**.

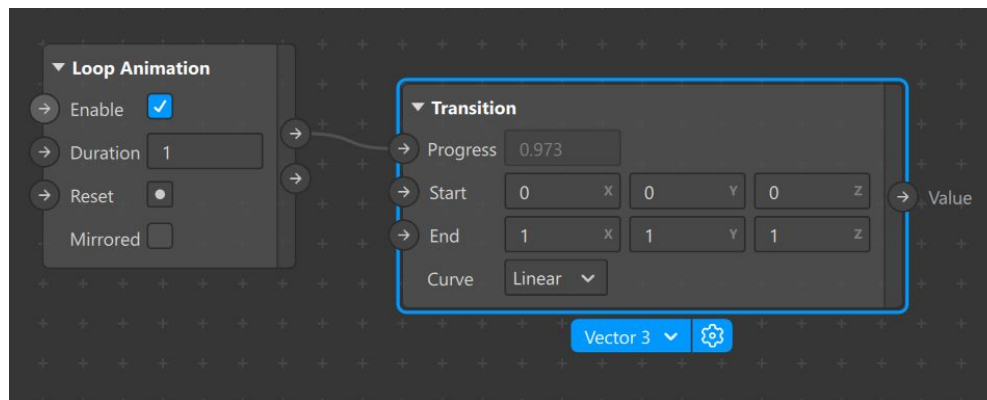

A **Loop Animation** block should show in the **Patch Editor**.

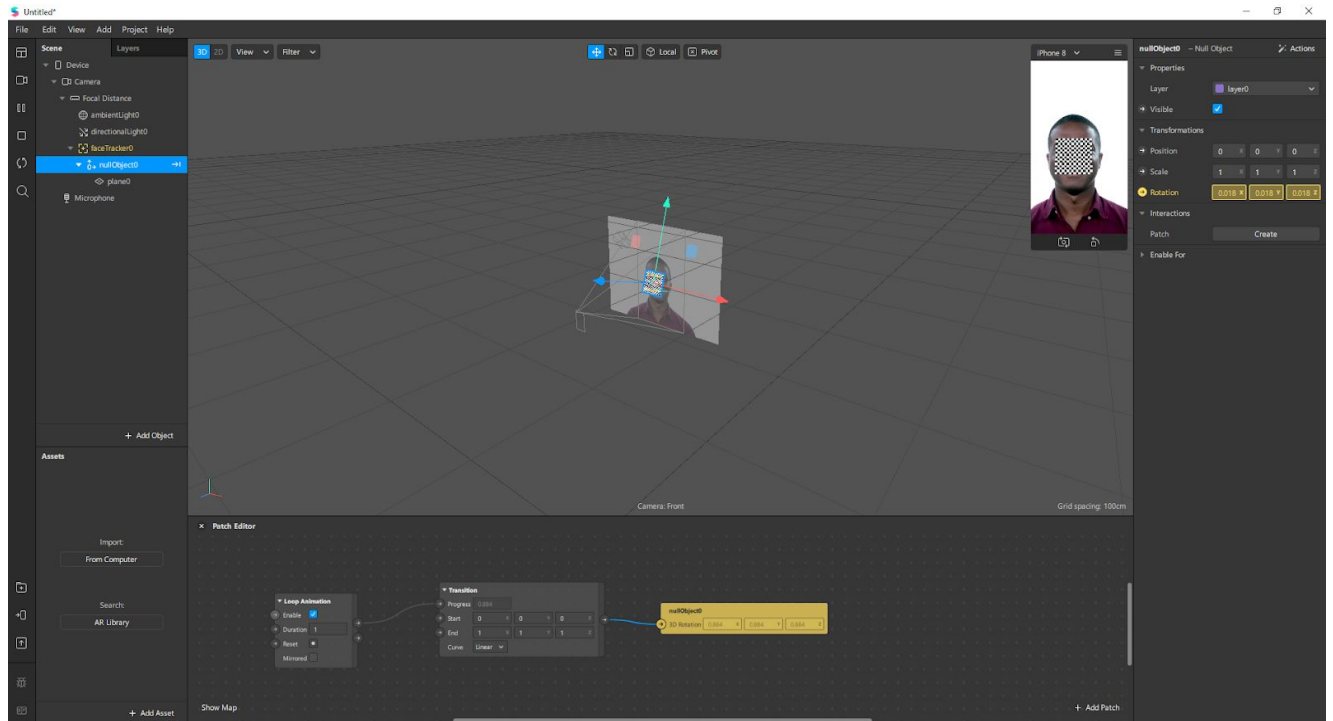

2. With **plane0** selected, right click in the **Patch Editor**, select **Animation** → **Transitions** then click on the button **Add Patch**.

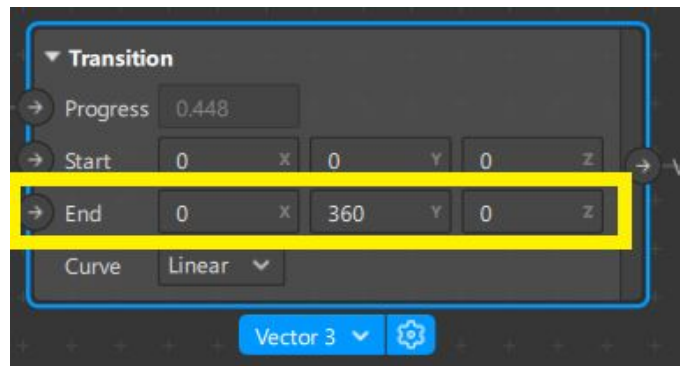

A **Transition** block should show in the **Patch Editor**.

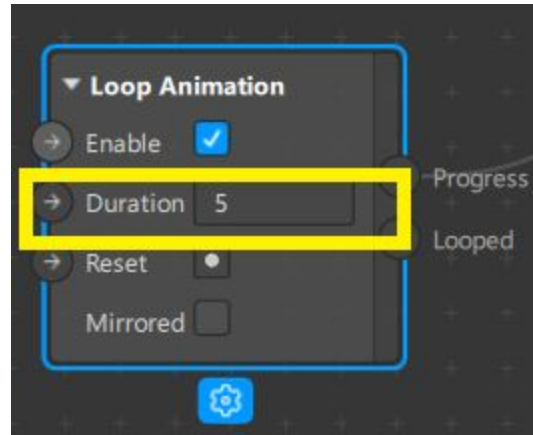

3. Select the **nullObject0**, located in **The Scene panel**, top left side of screen. In the **The Inspector** on the right side of the screen, click on the arrow in front of **Rotation**. This will turn the Rotation section yellow as shown below and a yellow block will appear in the **Patch Editor**. Link the Transition block to the Rotation block by clicking on the arrow located at the end of the Transition block and connecting it to the arrow in front of the Rotation block.

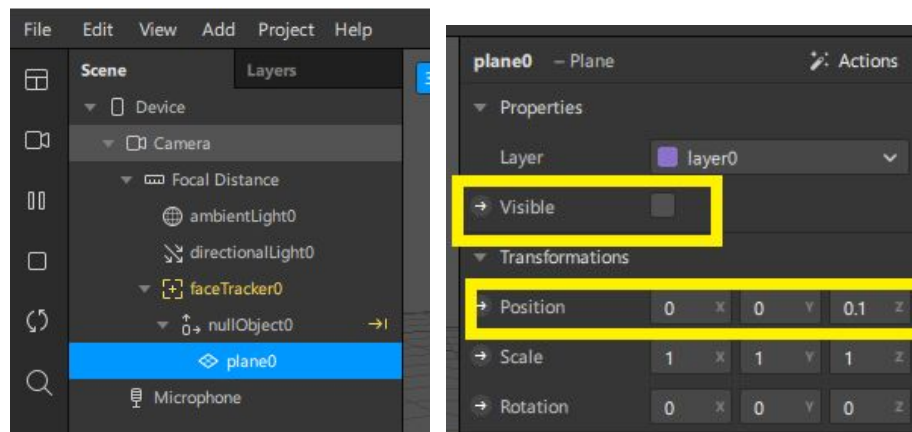

4. In the Transition block change the **End** values to x = 0, y = 360, and z = 0. This change will make the checker box speed in front of the person's face.

5. In the Loop Animation block change **Duration** to 5. This change will make the checker box spin slower.

6. Select **plane0**, located in **The Scene panel**, top left side of screen. Then set  $Z = 0.1$  for the **Position**, located in **The Inspector**, on the right side of the screen. This change will make the checker box spin and go around in front of the person's face. Make the **plane0** invisible by unchecking Visible on the Properties menu on **The Inspector**, right side of the screen. This will make the checker box disappear.

## Step 5: Working with Head Occluder

1. Now we need the Head Occluder. To get the Head Occluder go download the Head Occluder from <https://sparkar.facebook.com/ar-studio/learn/articles/people-tracking/face-reference-assets#whats-included-in-the-face-reference-assets>
2. Click on **Download the Face Reference Assets here**.

## Using the Spark AR Studio Face Reference Assets

The Face Reference Assets are a collection of textures and 3D objects. Use them when you're creating face effects in Spark AR Studio.

Download [the Face Reference Assets here](#).

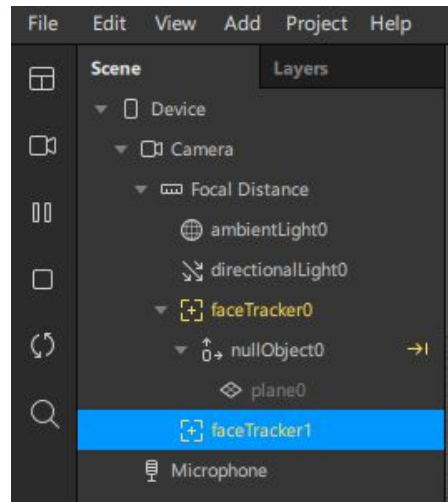

3. A zip folder will be downloaded to your computer. Unzip the folder wherever you would like to save the content of the zip folder. In the ***The Assets panel***, bottom left of screen, click **From Computer**. Browse to the location where you unzip your download. Open **headOccluder.obj**. In my case I saved mine to my documents at C:\User\Documents\FaceAssets\Mesh\headOccluder.obj

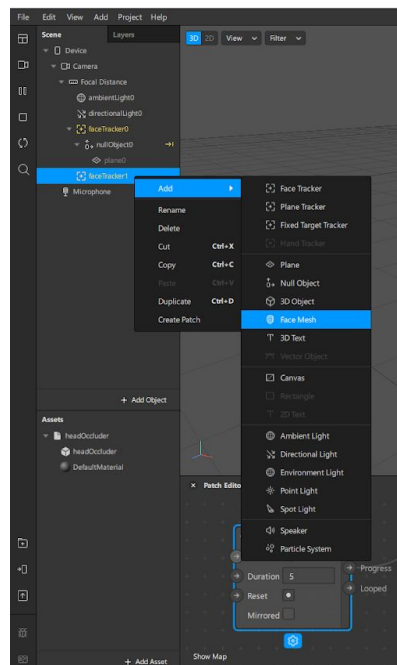

***The Assets panel***, should look like this.

4. Add another Face Tracker to **The Scene panel**, top left of screen, you should have two face trackers now. Click on **+ Add Object** → **Face Tracker** → **Insert**.

5. Right click on **faceTracker1**, then **Add** → **Face Mesh**.

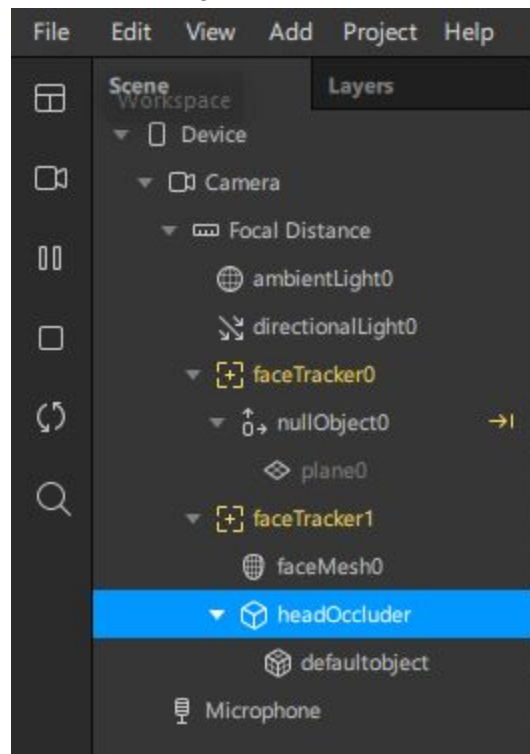

You should now see a checker pattern on the face of the person. Like this.

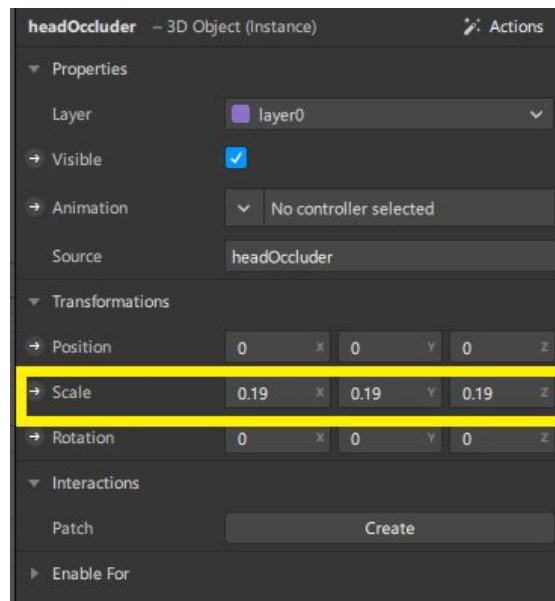

6. Drag the **headOccluder** object in **The Assets panel**, bottom left section, to the **faceTracker1** object, in **The Scene panel**, top left section.

This is what you will see in **The Viewport**.

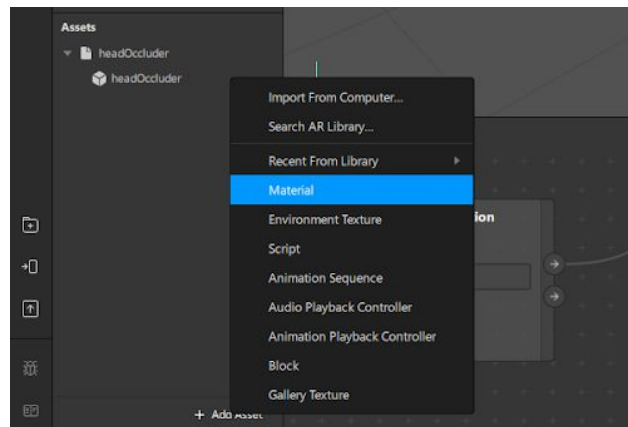

7. With the **headOccluder** selected go to the **The Inspector**, located on the right side of screen, change **Scale** to X = 0.19, Y = 0.19, Z = 0.19. *Play around with those values they may vary from screen to screen.* It has to be larger than the human head, but not too big.

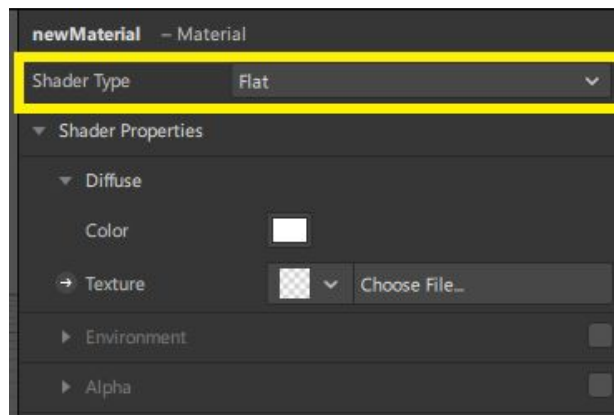

8. Delete from **The Assets panel**, bottom left of screen, **DefaultMaterial**. Right click on **DefaultMaterial** then select **Delete**.

9. In **The Assets pane**, located at the bottom left of screen, add an asset by clicking on **+** **Add Asset** and click on **Material**. You may rename it if you want, for the purpose of this tutorial this material will be named **newMaterial**.

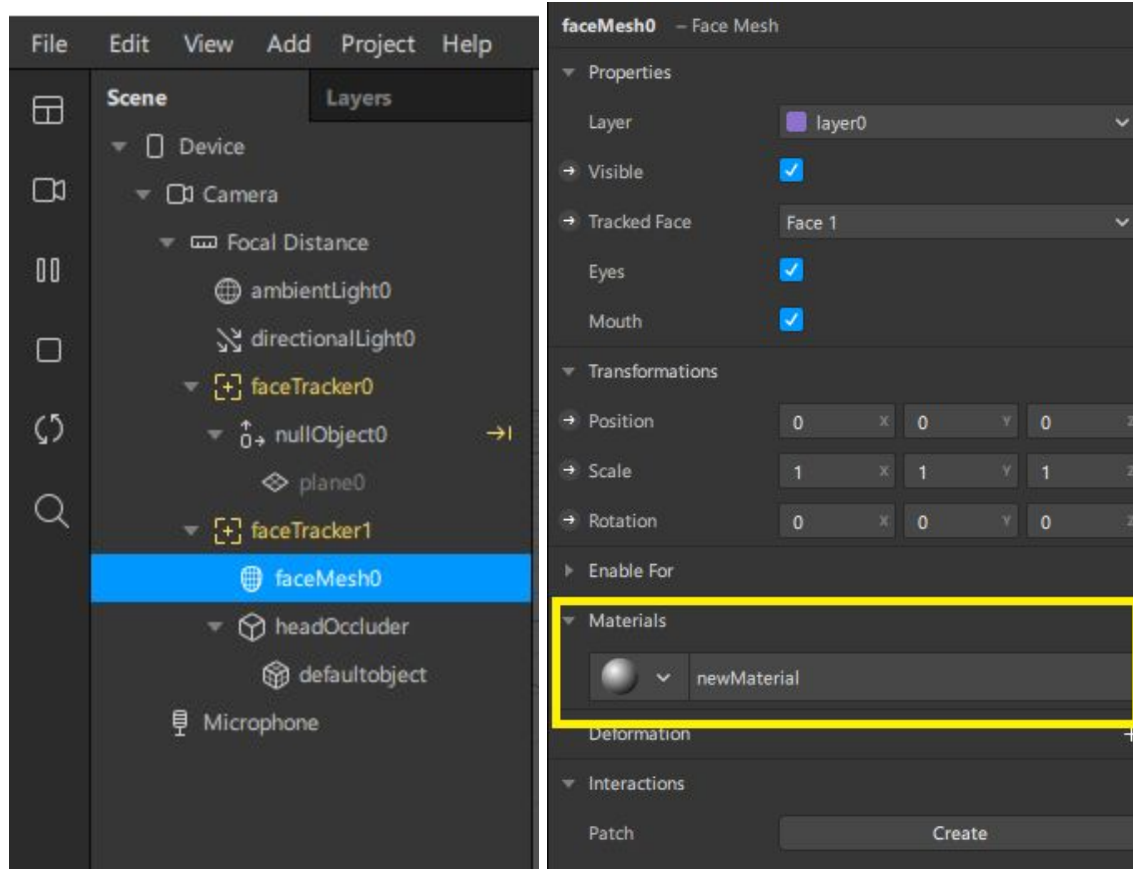

10. With **newMaterial** selected in the **The Assets panel**, go to **The Inspector**, right side of screen and change **Shader Type** to **Flat**.

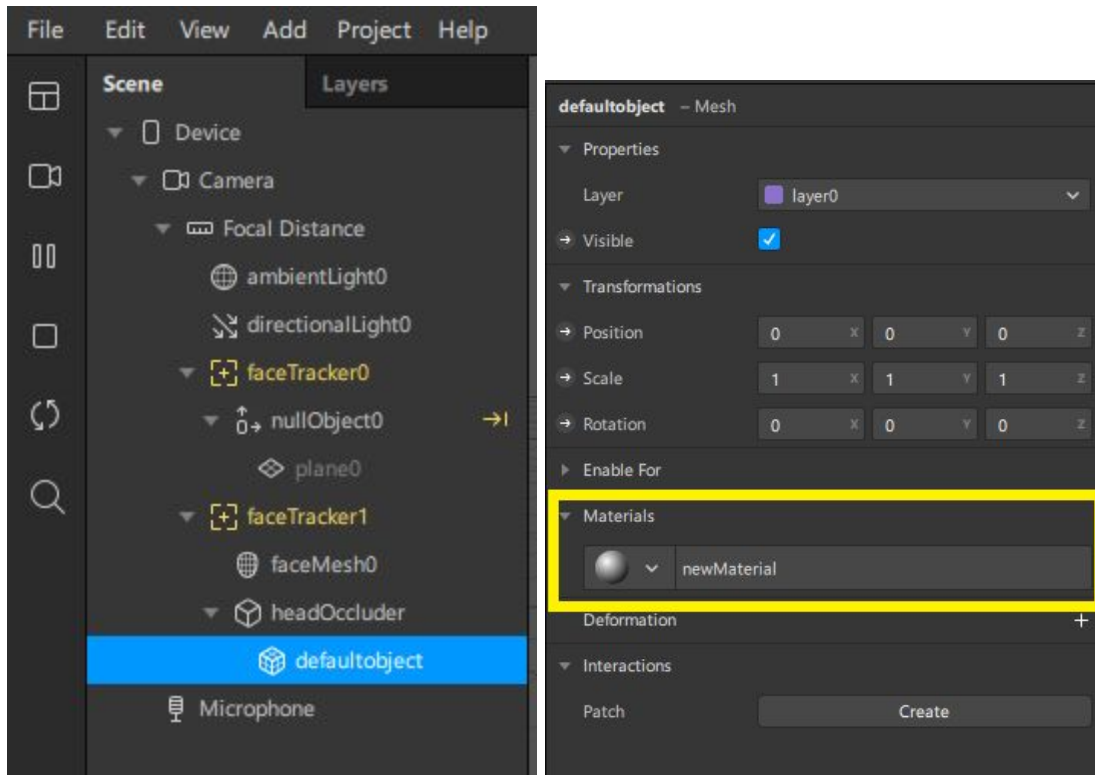

The figures should look like this.

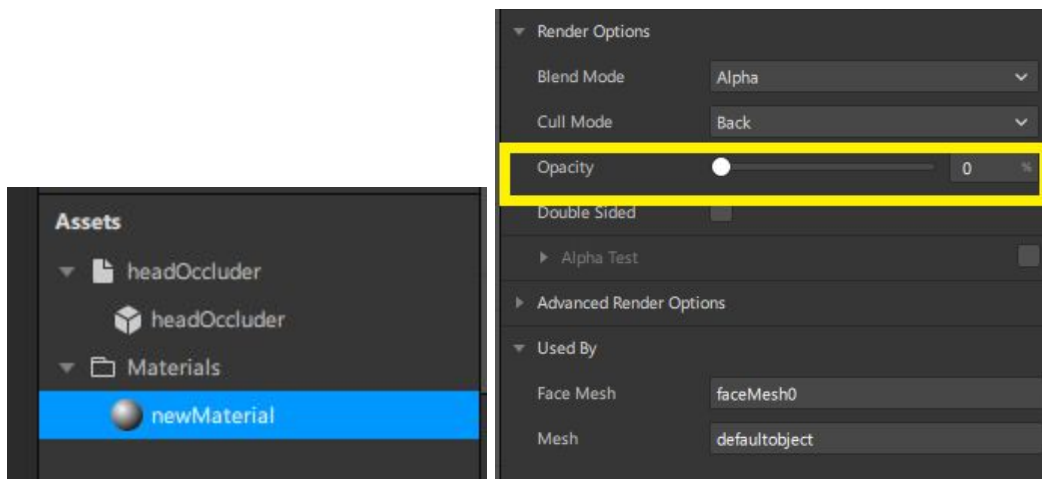

11. Select **faceMesh0** under **faceTracker1** on the **The Scene panel**, then in ***The Inspector***, right side of screen, add **newMaterial** to **Materials** by clicking the plus sign and selecting **newMaterial1**.

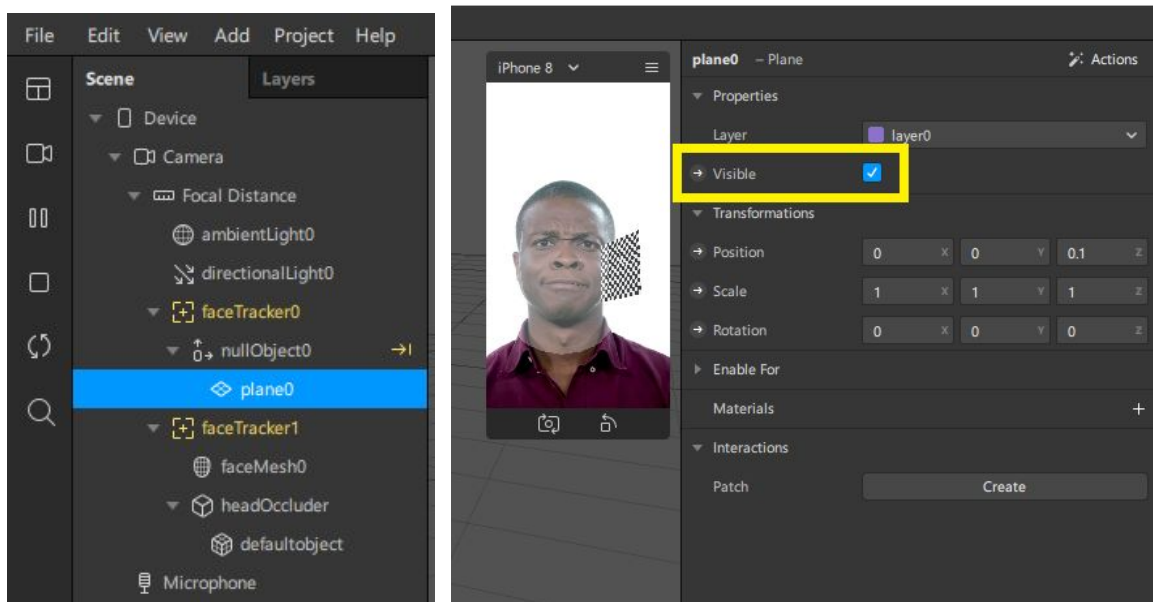

12. Select **defaultobject** under **headOccluder** in **The Scene panel**, top left side of screen.  
In **The Inspector**, the right side of the screen, change **Material** property to **newMaterial**.

13. In **The Assets panel**, bottom left of screen, select **newMaterial**. In **The Inspector**, the rightside of the screen, change the **Opacity** to 30 to be able to see the person's face. This will change later to 0 (zero).

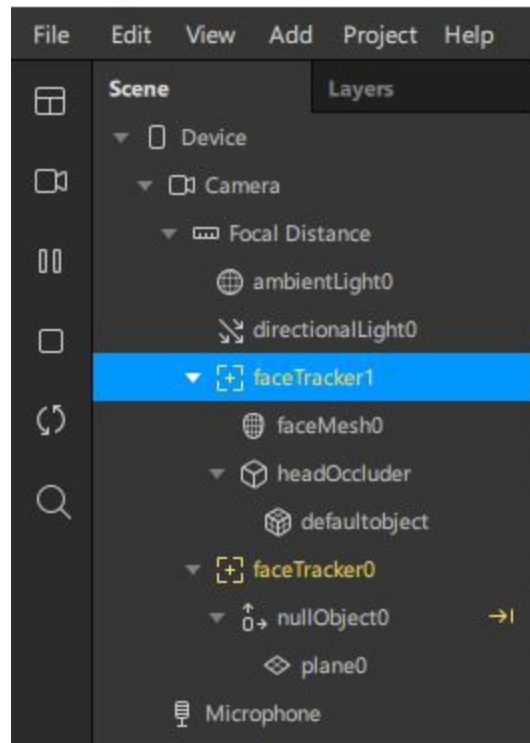

14. Select **plane0** under **faceTracker0** → **nullObject0** → **plane0** in *The Scene panel*, top left side of screen. In *The Inspector*, on the right side of the screen, check the **Visible** box to make the plane0 visible.

The image of the person should look like this.

15. To make the **plane0** rotate around the head, pull the **faceTraker1** to the top before **faceTraker0**, just like the picture. To do that just click and drag **faceTraker1** and drop it before **faceTraker0**.

16. Now we need to center the **nullObject0** to the head. Select **nullObject0**, under **faceTraker0**, in **The Scene plane**, top left screen, change the Z **Position** properties to Z = -0.2, this is located in **The Inspector**, right side of screen.

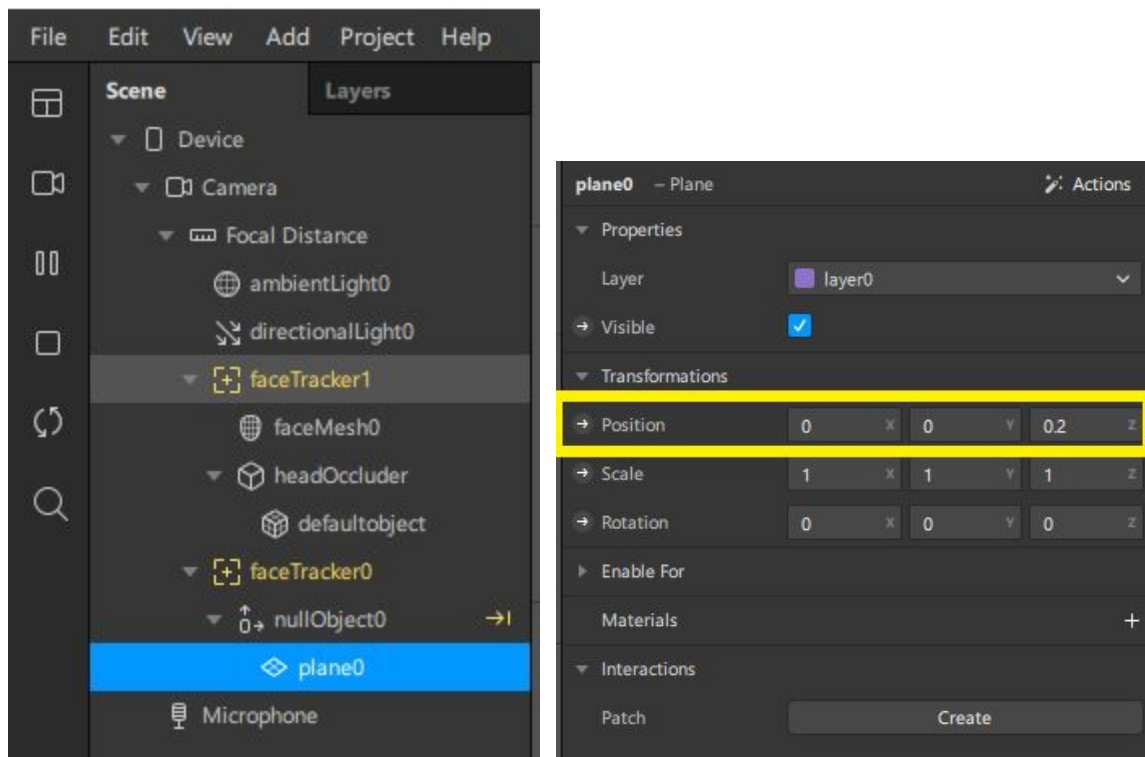

Here is the before and after of how the head should look.

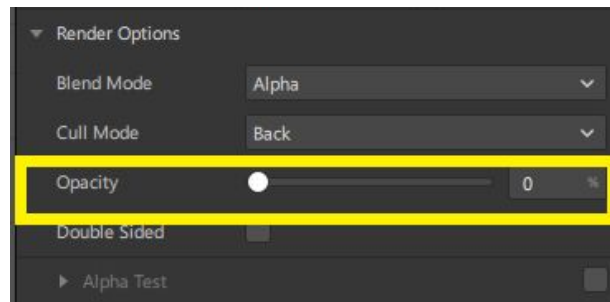

17. We need to update **plane0** to have it come in front and around the face. Select **plane0** under **faceTracker0** → **nullObjects0** → **plane0** in *The Scene panel*. In *The Inspector*, right side of screen, change the **Position** for Z to 0.2.

18. Now lets set the **newMateriaI** to invisible by selecting **newMaterial** under **The Assets panel** → **Materials** → **newMaterial**.

19. In **The Inspector**, right side of screen, under **Render Options** → **Opacity**, set **Opacity** to 0 (zero).

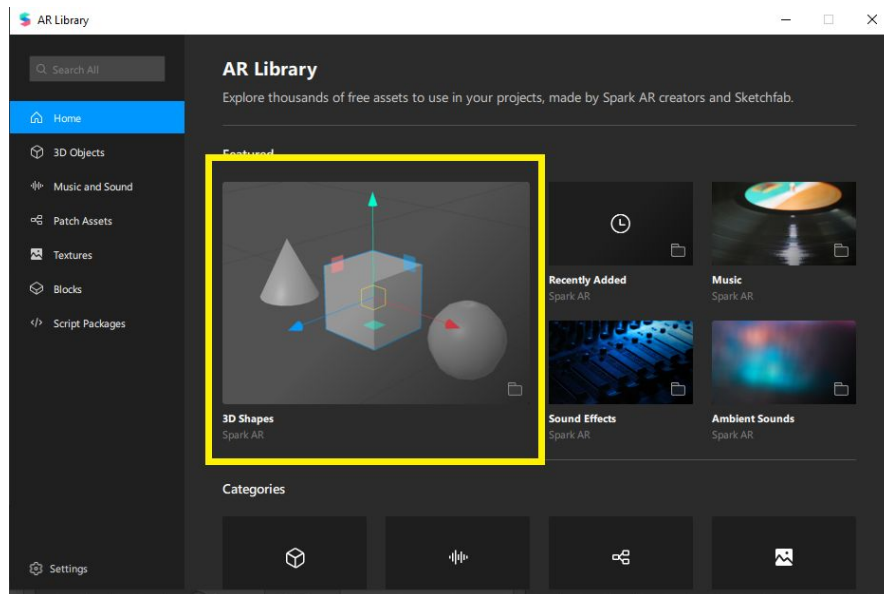

## Step 6: Lets add our 3D object that will be floating around the head

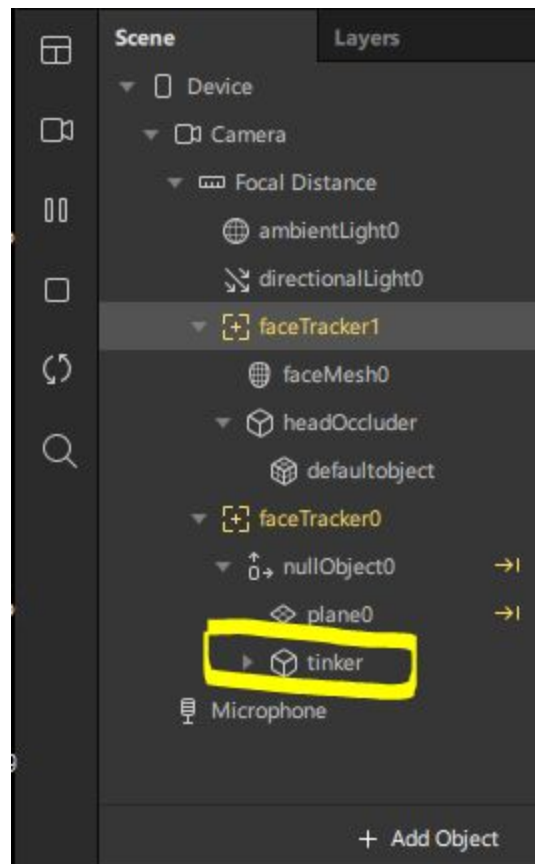

1. Under **The Assets panel** click on **+ Add Asset** and select **Search AR Library...**

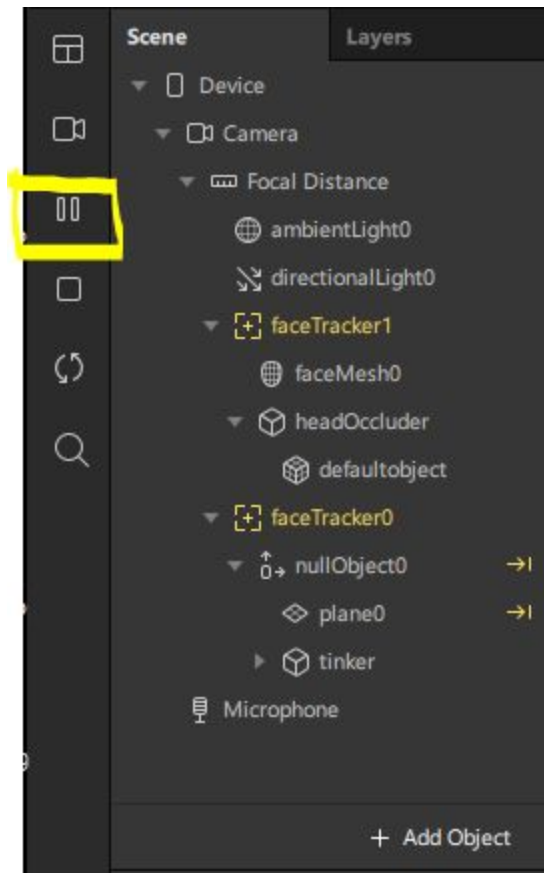

2. In the pop-up click on **3D Shapes** and select a shape. You can also import your own 3D object if you have one.

3. Get the 3D object and drag it under the **nullObject0**.

4. Press the pause button on **The Scene panel**, top left menu on the screen. Select the 3D object.

5. In **The Viewpoint** use the blue arrow to pull the 3D object towards the checker box object.

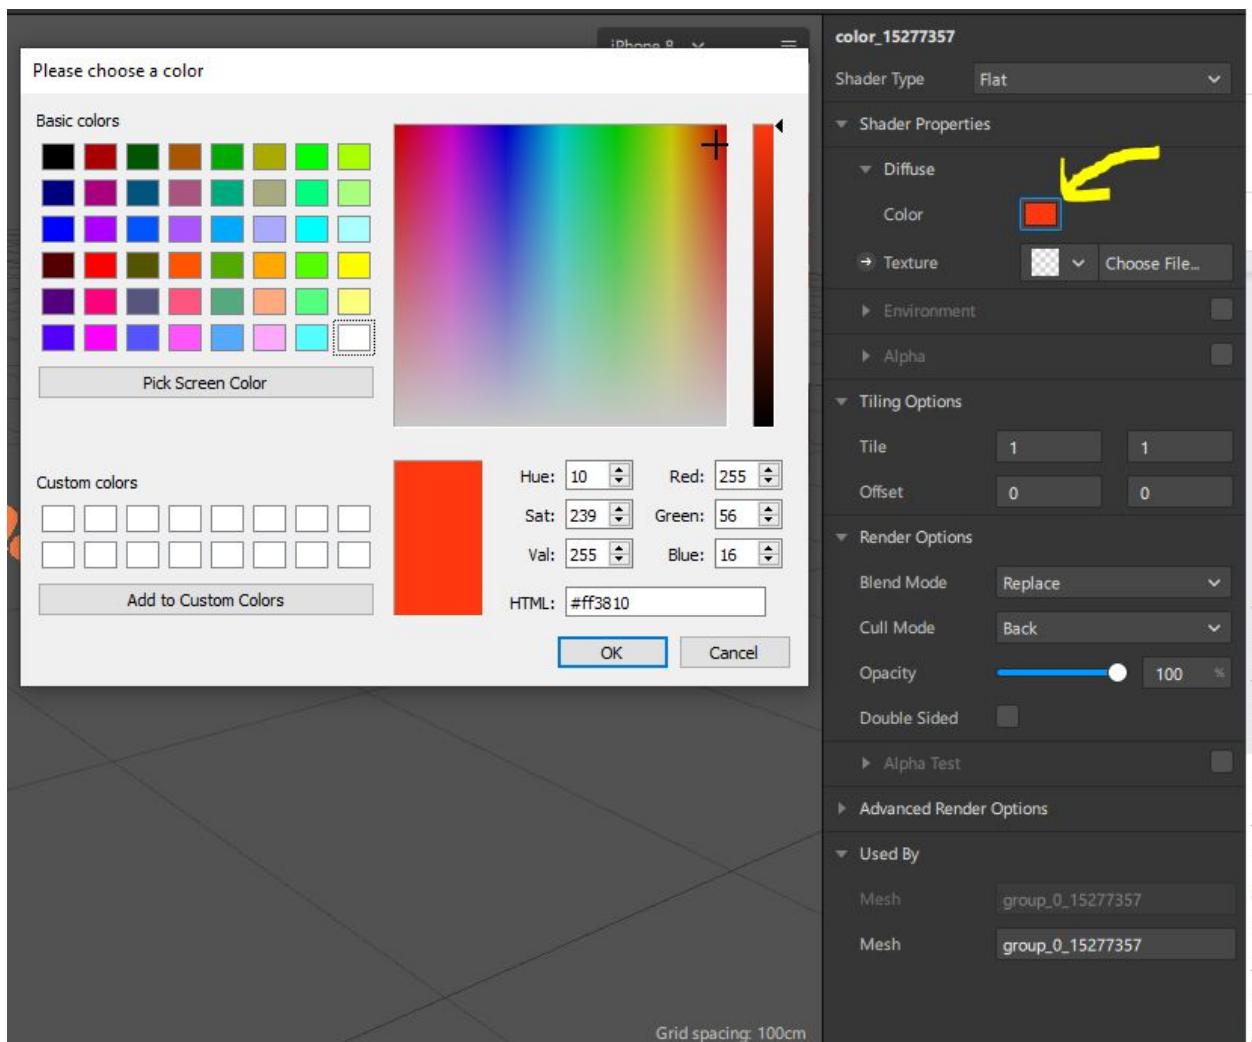

6. Pull the green arrow up, pass the checker box object. Press play to see how your 3D item looks. Adjust and also resize as needed.

7. If you are having a hard time seeing your image, you can change the color by selecting color under your object in the **Assets Pane**:

8. Then select the color you want in the **Inspector Pane**

All Done. Your image should look something like this.

Congratulations! You have just created your very own AR filter. Think of all the different possibilities you can do. There are many other different templates built into Spark AR. Give them a try and learn something new! Don't forget to have fun and share it with everyone!
